Import Data

Jan-Philipp Kolb

26 Februar, 2020

FIRST THINGS TO DO

Don't try to kiss your data on the first date; rather, you just want to get to know the data:

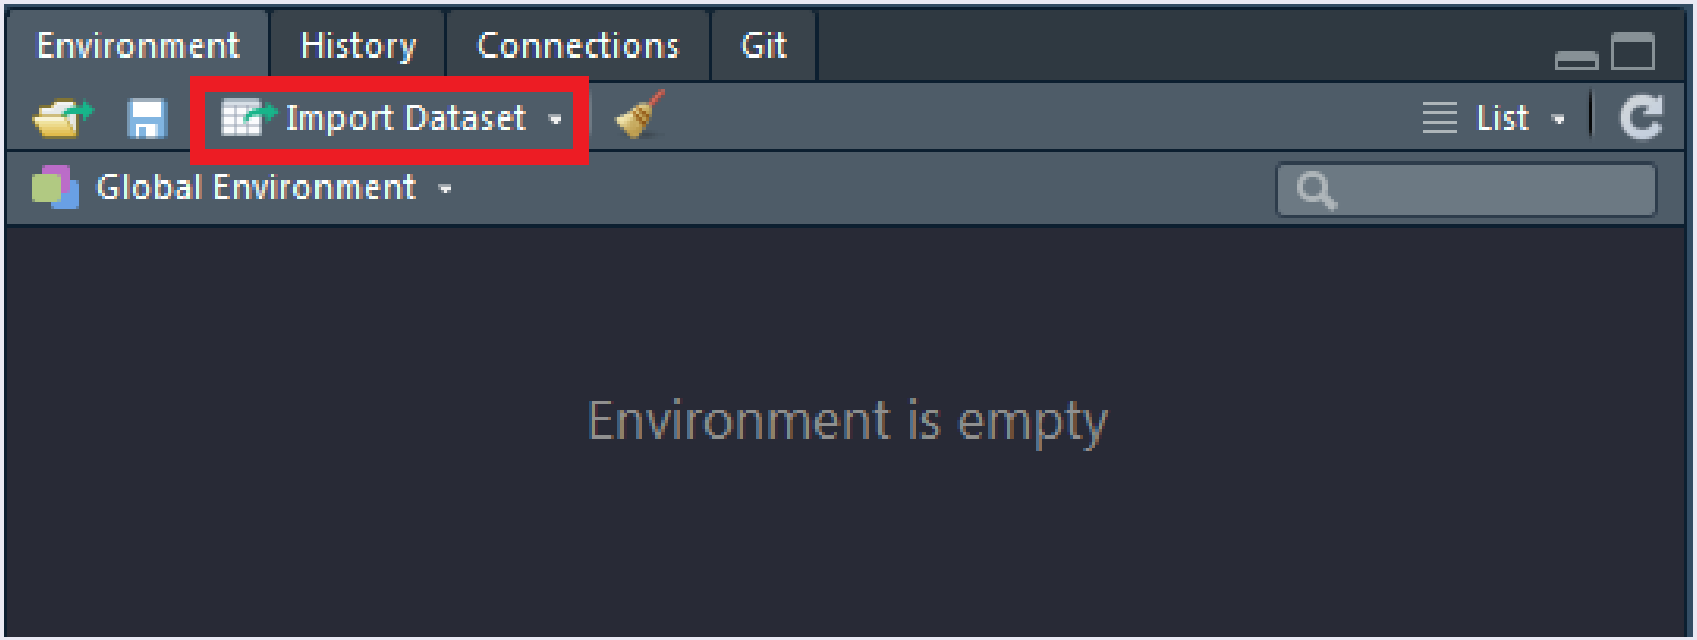
1. **Import the data**
2. Review the codebook
3. Learn about the data
4. Quick visual understanding of the data

Data import

Import data with Rstudio

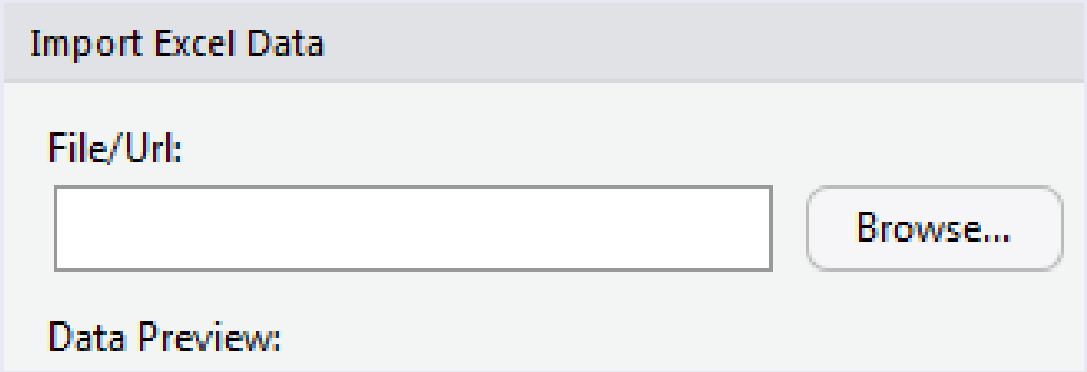
Rstudio functionality to import data

- Environment - Import Dataset - choose file type



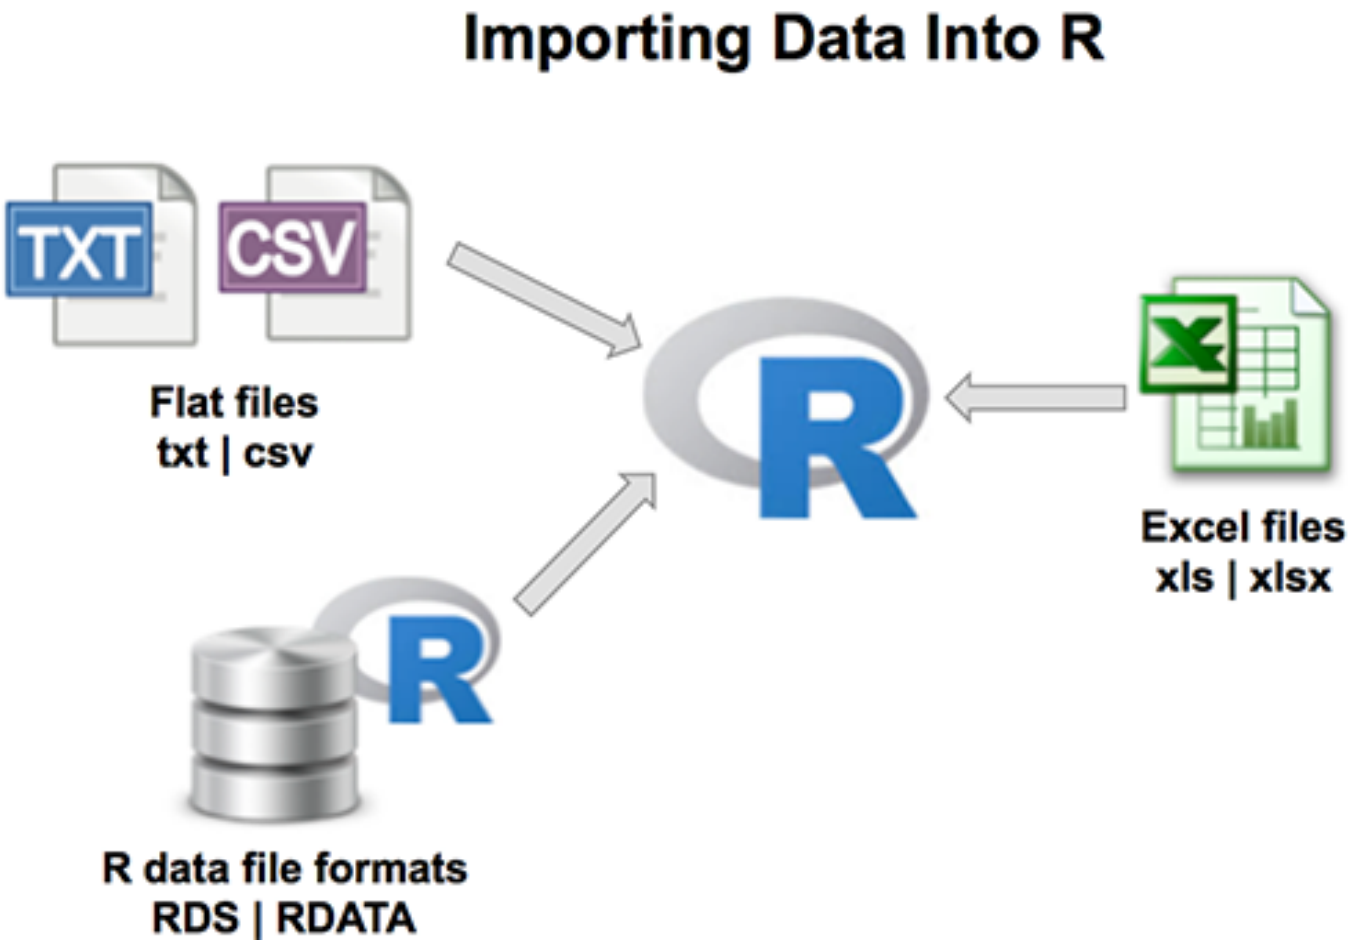
Where to find data

Browse Button in RStudio



Code preview in Rstudio

Import .csv data



Import of csv data

- `read.csv` is a command available in base package
- Excel data can be saved as `.csv` in Excel
- Then `read.csv()` can be used to read in the data.
- For German data, you may need `read.csv2()` because of the comma separation.

```
dat <- read.csv("../data/ZA5666_v1-0-0.csv")
```

If it's German data:

```
datd <- read.csv2("../data/ZA5666_v1-0-0.csv")
```

```
dat <- read.csv("../data/datahub_refugee.csv")
```

The result - a data.frame

- the following data.frame is a small excerpt from the data:

```
head(dat)
```

```
##   Country.Name Country.Code Year   Value
## 1   Arab World          ARB 1990 4235545
## 2   Arab World          ARB 1991 3811595
## 3   Arab World          ARB 1992 4000509
## 4   Arab World          ARB 1993 4189545
## 5   Arab World          ARB 1994 4352945
## 6   Arab World          ARB 1995 4337009
```

The package readxl

```
install.packages("readxl")
```

- **`readxl` has no external dependencies**
- `readxl` supports both the legacy `.xls` format and the modern xml-based `.xlsx` format.

```
library(readxl)
ab <- read_excel("../data/datahub_names_sa.xlsx")
head(ab)
```

```
## # A tibble: 6 x 3
##   ...1  X1           X2
##   <chr> <chr>        <chr>
## 1 1     0.0036749995 JOHN
## 2 2     0.0036418888 JOHANNES
## 3 3     0.0031182974 DAVID
## 4 4     0.0030492798 MICHAEL
## 5 5     0.0029608373 JACOBUS
## 6 6     0.0027139047 MARIA
```

Import SPSS files

Import GESIS Panel data

- library `haven` - import and export 'SPSS', 'Stata' and 'SAS' files
- the result of this import command is a tibble

```
library(haven)
dataset <- read_sav("../data/datahub_government_africa.sav")
```

```
> dataset
# A tibble: 53 x 5
            Country   Government                  Name          since  Term
          <dbl+lbl>    <dbl+lbl>                <dbl+lbl>      <dbl+lbl> <dbl>
 1 16 [Equatorial ~ 3 [Presiden~ 51 [Teodoro Obiang Ng~ 31 [3 August ~    39
 2  8 [Cameroon]    3 [Presiden~ 45 [Paul Biya]          44 [6 Novembe~    36
 3 51 [Uganda]      3 [Presiden~ 53 [Yoweri Museveni]    29 [29 Januar~    32
 4 47 [Sudan]       3 [Presiden~ 42 [Omar al-Bashir]     33 [30 June 1~    29
 5 10 [Chad]        3 [Presiden~ 24 [Idriss DÃ©by]       10 [2 Decembe~    28
 6 17 [Eritrea]     3 [Presiden~ 25 [Isaias Afwerki]     18 [24 May 19~    25
 7 12 [Congo]       3 [Presiden~ 12 [Denis Sassou Ngue~ 23 [25 Octobe~    21
```

Import data from the web

Austrian microcensus

Files can also be imported directly from the Internet:

```
library(foreign)
link <- "http://www.statistik.at/web_de/static/
mz_2013_sds_-_datensatz_080469.sav"

?read.spss
Dat <- read.spss(link,to.data.frame=T)
```

Import stata files

Import newer .dta files

- With `read.dta13` stata files from version 13 (and higher) can be imported

```
library(readstata13)
dat_stata <- read.dta13("../data/example_gp.dta")
```

Import stata files - older versions

```
library(foreign)
dat_stata12 <- read.dta("../data/example_gp_stata12.dta")
```

readstata13 {readstata13} R Documentation

Import Stata Data Files

Description

Function to read the Stata file format into a data.frame.

Note

If you catch a bug, please do not sue us, we do not have any money.

`read.dta` and `memisc` for dta files from Stata Versions < 13

Import - GESIS Panel data

convert.factors argument

```
library(readstata13)
```

```
datf <- read.dta13("../data/example_gp.dta",
                   convert.factors = F)
head(datf$bbzc007a)
```

```
## NULL
```

For comparison - import without this argument

```
dat <- read.dta13("../data/example_gp.dta")
head(dat$bbzc007a)
```

```
## NULL
```

The argument convert.factors = F

More information on .dta import

```
?read.dta13
```

- `convert.factors` - logical. If `TRUE`, factors from Stata value labels are created.
- It might be useful to import the dataset twice - with and without value labels...
- `nonint.factors`- logical. If `TRUE`, factors labels will be assigned to variables of type float and double.
- The import must be controlled, because otherwise errors can easily happen.

Get stata attributes

```
att_dat <- attributes(dat)
head(names(att_dat))
```

```
## NULL
```

Example: the variable names

```
head(att_dat$names)
```

```
## NULL
```

Get an initial overview of the data

```
View(datf)
```

Filter

	z000001z Personen ID - Campus File	z000002z Studiennummer des Archivs	z000003z Versionskennung und -datum des Archivs	z000005z doi	a11c019a Zufriedenheit Leben in Wohnort	a11c020a Zufriedenheit
1	198431880	ZA5666	1-0-0 2017-06-20	10.4232/1.12749	1	
2	436122330	ZA5666	1-0-0 2017-06-20	10.4232/1.12749	1	
3	856844220	ZA5666	1-0-0 2017-06-20	10.4232/1.12749	2	
4	117346660	ZA5666	1-0-0 2017-06-20	10.4232/1.12749	1	
5	943433330	ZA5666	1-0-0 2017-06-20	10.4232/1.12749	1	

- You can get the same in RStudio if you click on the dataset icon in the environment menue

The library rio

```
install.packages("rio")
```

```
library("rio")
x <- import("../data/ZA5666_v1-0-0.csv")
y <- import("../data/ZA5666_v1-0-0_Stata12.dta")
z <- import("../data/ZA5666_v1-0-0_Stata14.dta")
```

- **rio: A Swiss-Army Knife for Data I/O**

The package Hmisc

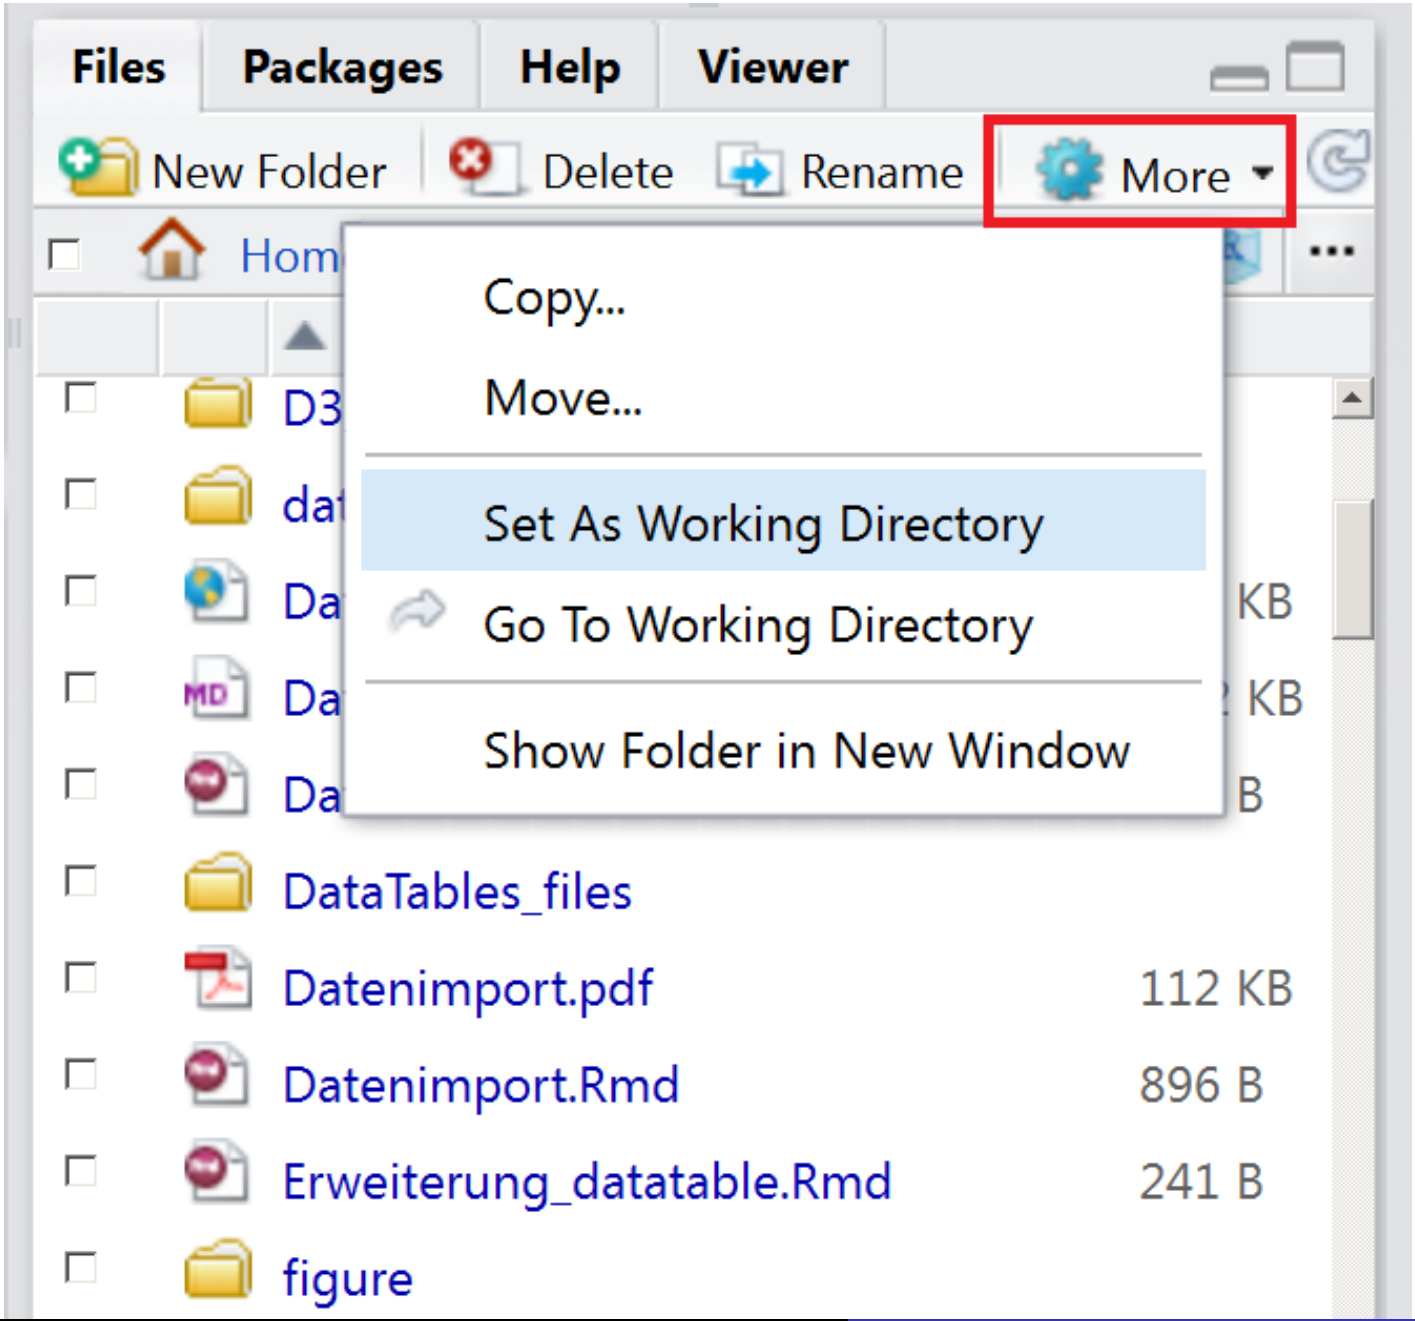
For SPSS and SAS I would recommend the Hmisc package for ease and functionality.

```
library(Hmisc)
mydata <- spss.get("c:/mydata.por", use.value.labels=TRUE)
# last option converts value labels to R factors
```

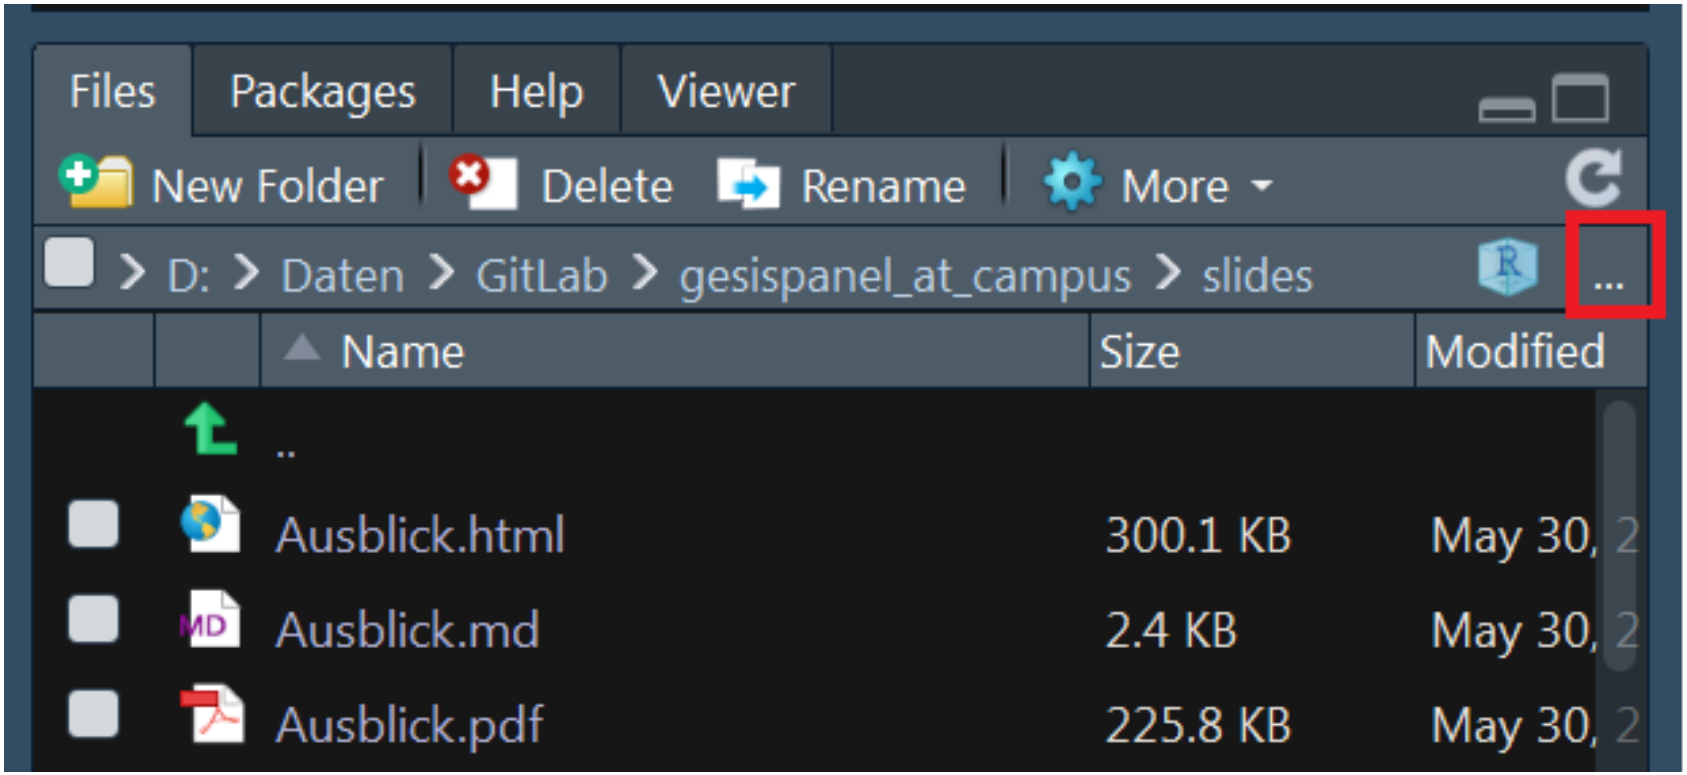
Import SAS data

```
mydata <- sasxport.get("c:/mydata.xpt")
# character variables are converted to R factors
```

The working directory



- If the data is on a different drive in Windows



The working directory II

This way you can find out which directory you are currently in

```
getwd()
```

So you can change the working directory:

You create an object in which you save the path:

```
main.path <- "C:/" # Example for Windows
main.path <- "/users/Name/" # Example for Mac
main.path <- "/home/user/" # Example for Linux
```

And then change the path with `setwd()`

```
setwd(main.path)
```

On Windows it is important to use slashs instead of backslashes.

Change working directory

- You can also use the tab key to get the autocompletion.

```
getwd()
```

```
## [1] "E:/github/intror2020/slides"
```

```
setwd("..")
getwd()
```

```
## [1] "E:/github/intror2020"
```

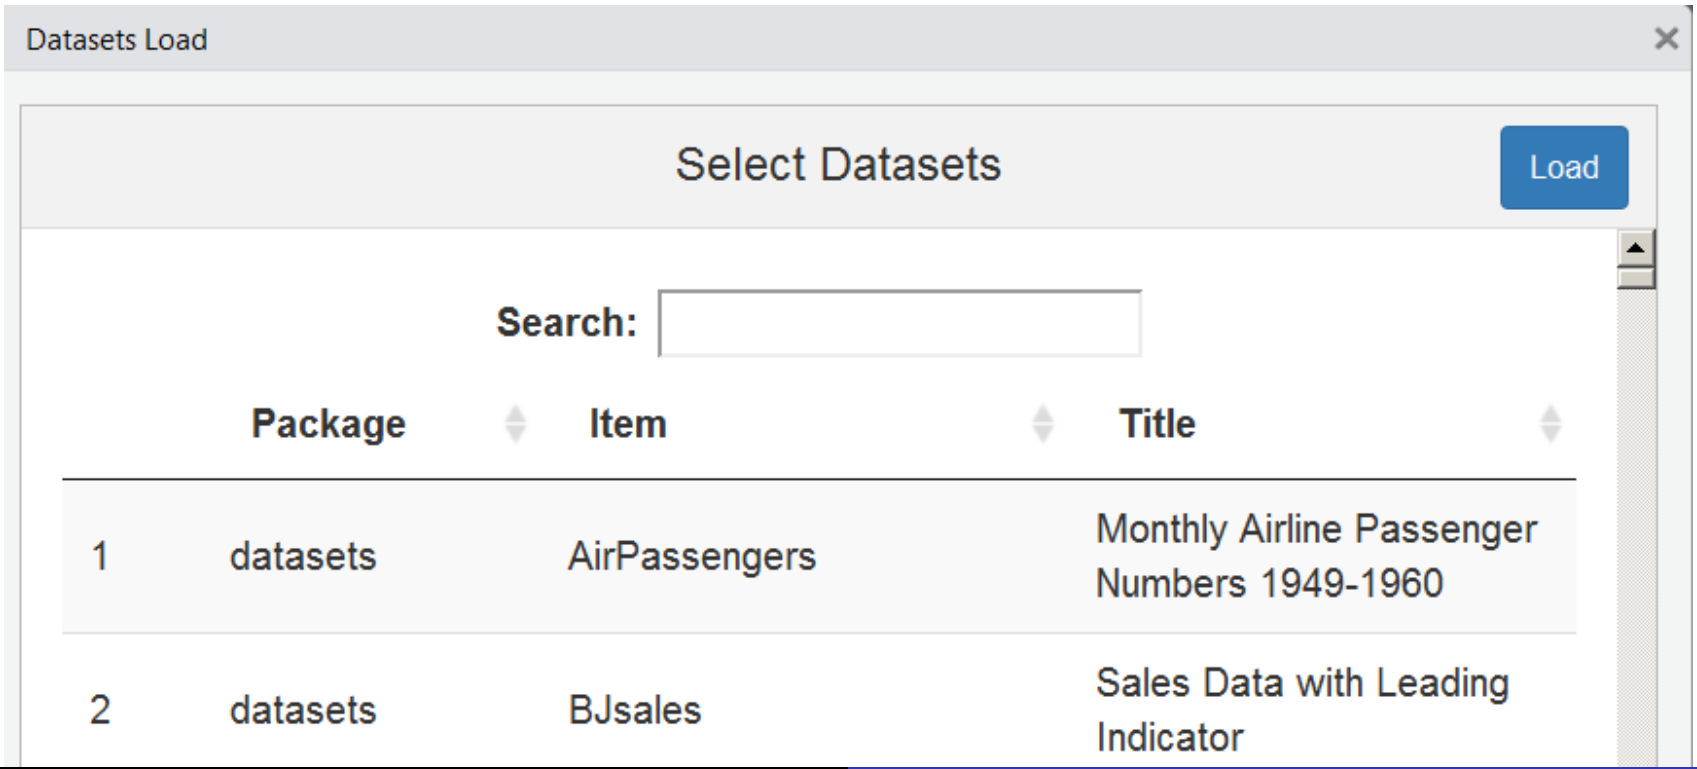
Built-In datasets

- Often an example dataset is provided to show the functionality of a package
- These datasets can be loaded with the command `data`

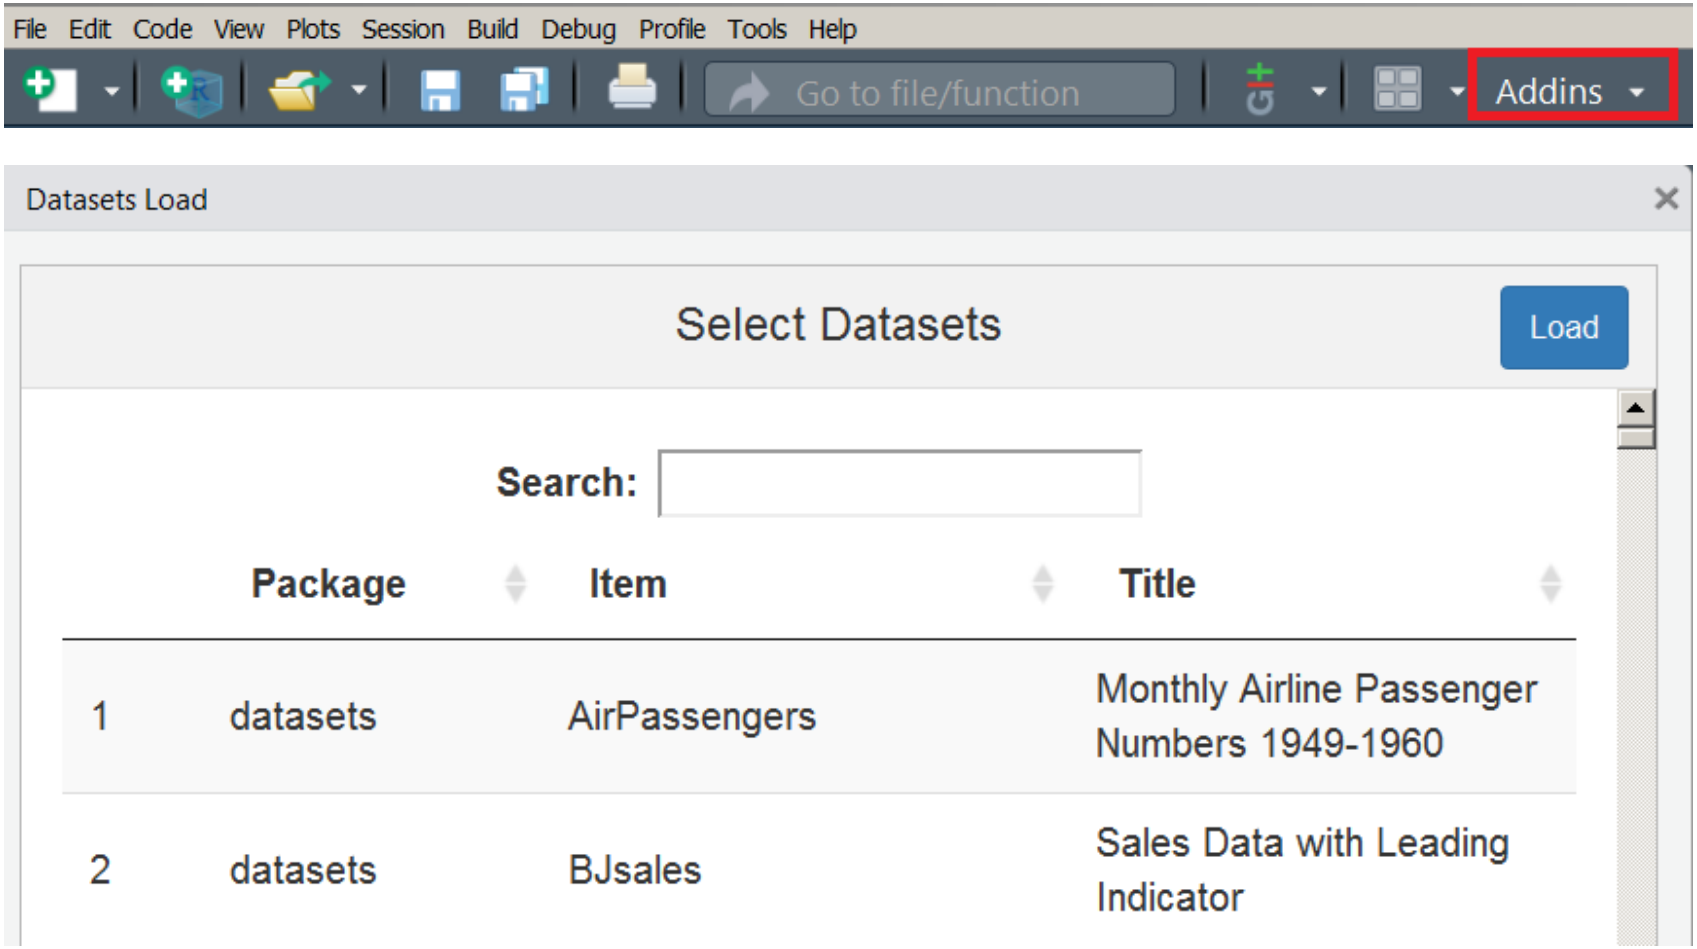
```
data(iris)
```

- There is also an **RStudio add-in** that helps to find a dataset

```
install.packages("datasets.load")
```



- In the upper right corner there is a button Addins



Exercise: load built-in data

Load the the built-in dataset `mtcars`

1) How many observations and variables are available?
2) What is the object structure of the variables?

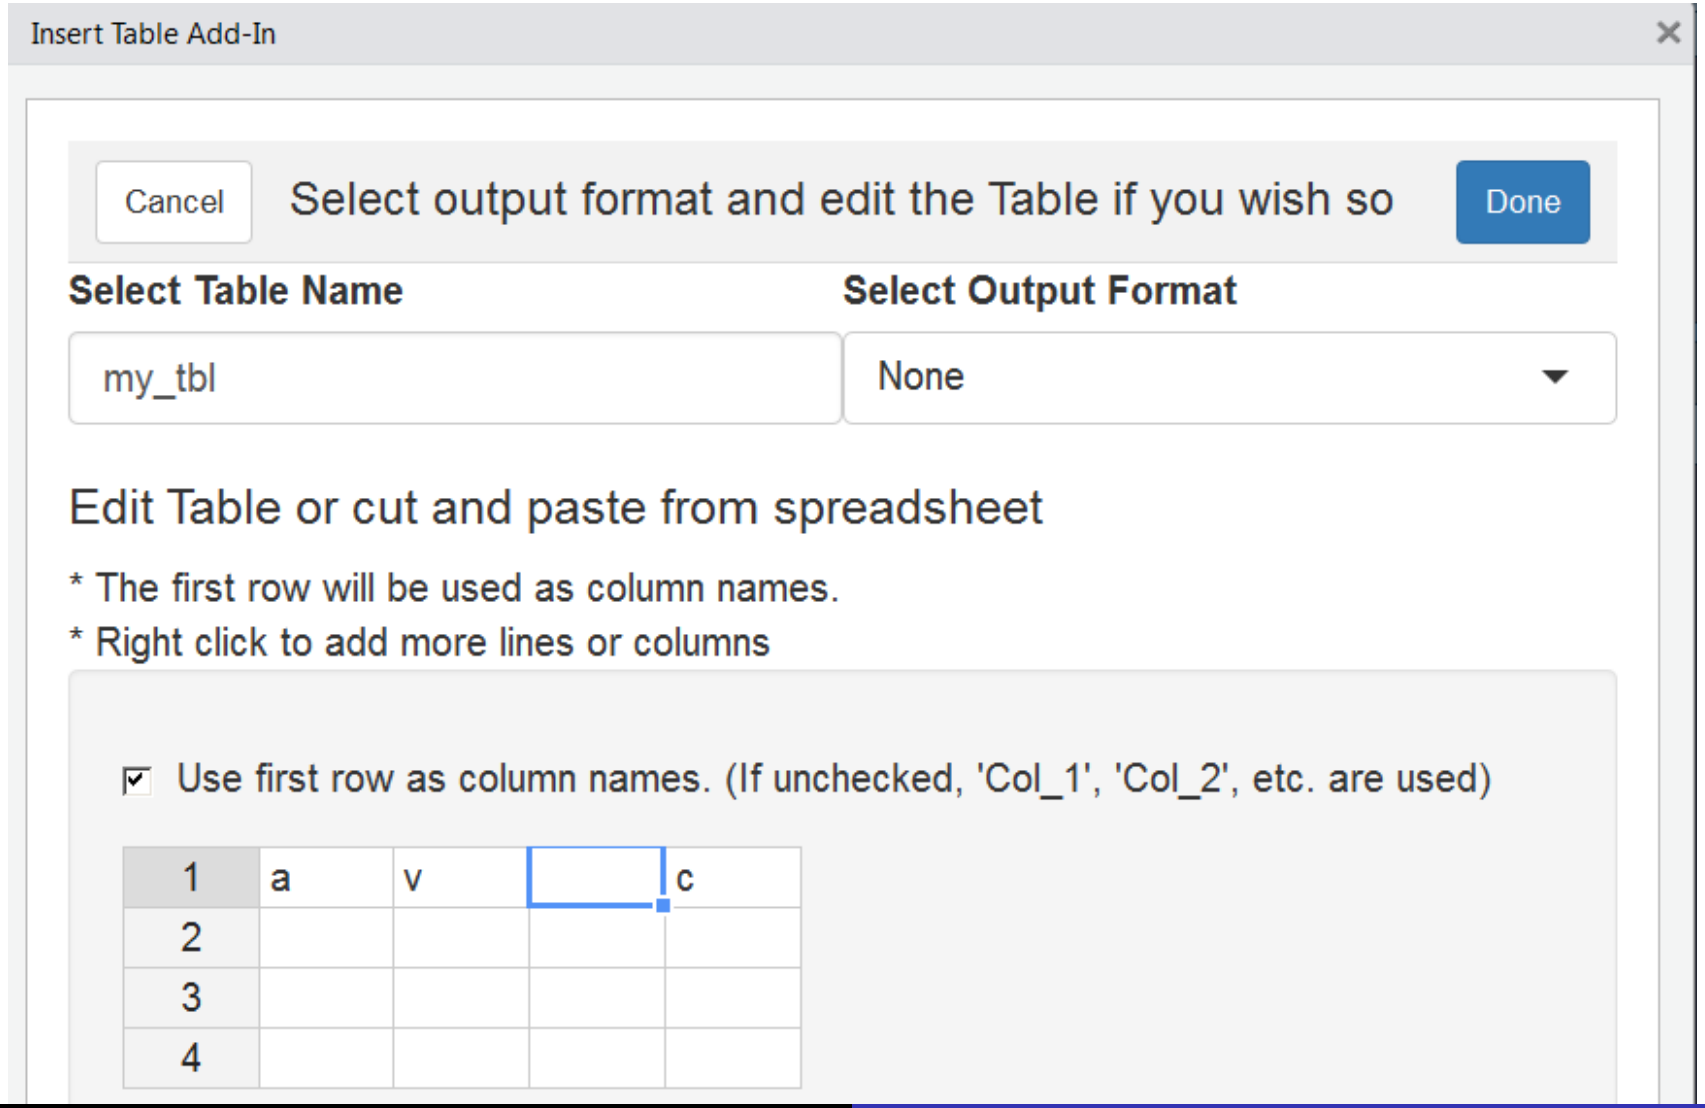
Interactive data table

3) Create an interactive data table

Inserting data

- **RStudio addin for inserting data**

```
devtools::install_github("lbusett/insert_table")
```



The file.choose option

- You can browse through the directory with `file.choose`:

```
dat <- read.csv(file.choose())
```

- If you run the command line above a window is opened and you can browse in the file system.
- That also works with other import functions

Creating an example data record

```
A <- c(1,2,3,4)
B <- c("A","B","C","D")

mydata <- data.frame(A,B)
```

```
mydata
```

A	B
1	A
2	B
3	C
4	D

Overview data import/export

- if you continue working with R, `.RData` or **`rds`** format is the best choice:

```
save(mydata, file="mydata.RData")
saveRDS(mydata, "mydata.rds")
```

- The data set can be imported with `load`.

```
load("mydata.RData")
mydata <- readRDS("mydata.rds")
```

- `saveRDS()` doesn't save the both the object and its name it just saves a representation of the object

Overview import functions

Package	Function	.CSV	.TSV	.TXT	FIXED WIDTH	SPECIAL SEPARATOR
utils (Base R)	read.csv	x				
	read.delim		x			
	read.table			x		x
readr	read_csv	x				
	read_tsv		x			
	read_table			x	x	
	read_fwf				x	
	read_delim					x
data.table	fread	x	x	x	x	x
