Introduction to R

Creating maps

Jan-Philipp Kolb

04 März, 2020

The package `tmap`

```
library(tmap)
```

cartography | earthquake | leaflet | bubble | legend | raster | shape | crimes | animated | plot | lines | e walker | london | thematic | mapping | interactive

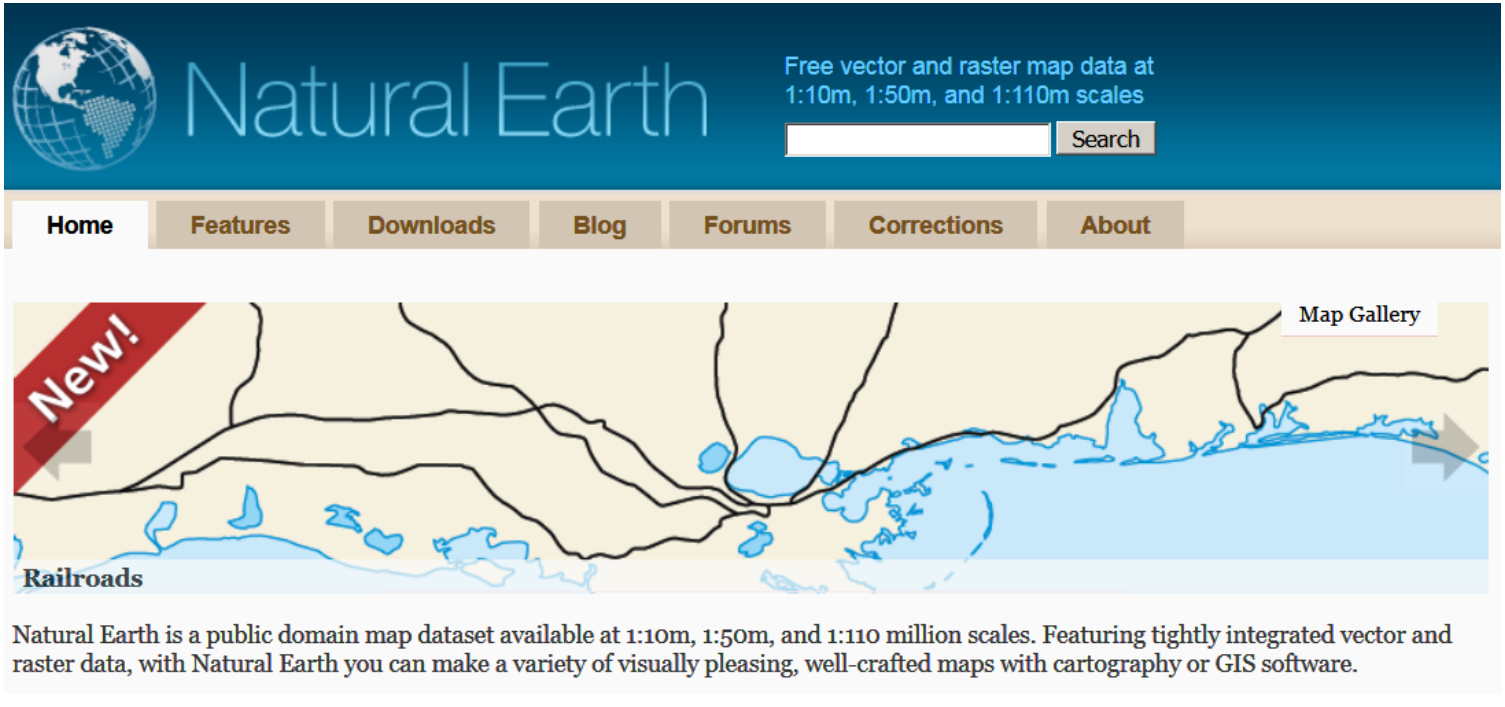
The `World` dataset

Natural Earth

- Dataset contains information from **Natural Earth**

```
data(World)
```



The `qtm` command from the `tmap` package

Fast thematic map

- With the command **qtm** you can create a fast thematic map
- Example from the **Vignette** for the `tmap` package

```
qtm(World)
```

The World-Dataset

The World Dataset in Package `tmap`

RPubs brought to you by RStudio

To get more color in the map

economic development status

```
qtm(World, fill="economy")
```

A map with text

Population

```
qtm(World, fill="pop_est", text="iso_a3")
```

This Scheme is better:

GDP

```
qtm(World, fill="gdp_cap_est", text="iso_a3",
    text.size="AREA", root=5, fill.title="GDP per capita",
    fill.textNA="Non-European countries", theme="Europe")
```

Topics of the World dataset

Available variables in the data set

- **ISO classification**
- country name
- Area, population, population density,
- **Gross Domestic Product**
- Gross domestic product **at purchasing power parities**
- Economy, income group

The World Dataset - Variables and what's behind

iso_a3 name sovereignt continent area

AFG Afghanistan Afghanistan Asia 652860.000 [km^2] AGO Angola Angola Africa 1246700.000 [km^2] ALB Albania Albania Europe 27400.000 [km^2] ARE United Arab Emirates United Arab Emirates Asia 71252.172 [km^2] ARG Argentina Argentina South America 2736690.000 [km^2] ARM Armenia Armenia Asia 28470.000 [km^2] ATA Antarctica Antarctica Antarctica 12259213.973 [km^2] ATF Fr. S. Antarctic Lands France Seven seas (open ocean) 7257.455 [km^2]

The variable `continent`

```
qtm(World, fill="continent")
```

The variable `area`

```
qtm(World, fill="area") # Russia is huge
```

Population

```
qtm(World, fill="pop_est",fill.title="Population")
```

Two maps

Population and level of development

```
tm_shape(World) + tm_fill(c("pop_est", "economy"),
        title=c("Population", "Economy"))
```

Visualize only one country

```
tm_shape(World[World$name=="Austria", ]) +
    tm_polygons()
```

Load example data

Data source Eurostat

- Data about unemployment in Europe

```
url1<-"https://raw.githubusercontent.com/Japhilko/GeoData/"
url2<-"master/2015/data/Unemployment07a13.csv"
url <-paste0(url1,url2)
Unemp <- read.csv(url)
```

An overview of the data

```
X  GEO     Val2007M12   Val2013M01
```

9316 EU28 6.9 10.9 9325 EU27 6.9 10.9 9334 EU25 6.9 11.0 9343 EU15 6.9 11.1
9352 EA 7.3 12.0 9361 EA19 7.3 12.0 9370 EA18 7.4 12.0 9379 EA17 7.4 12.0
9388 EA16 7.4 12.0 9397 EA15 7.3 12.0

Excursus: the command `match`

Create two example vectors

```
vec_a <- c("A",2,6,1,"C")
vec_b <- c(1,"C",2)
```

Bringing the two vectors together

- With the function `match` you can see which element of the first vector matches the second vector.

```
match(vec_a,vec_b)
```

```
## [1] NA  3 NA  1  2
```

Use the package `tmap` with your data

```
library("tmap")
```

Match the data

```
iso_a2<- substr(World$iso_a3,1,2)
ind <- match(iso_a2,Unemp$GEO)
World$Val2007M12 <- Unemp$Val2007M12[ind]
World$Val2013M01 <- Unemp$Val2013M01[ind]
```

Plot a map

```
qtm(World,c("Val2007M12","Val2013M01"))
```

Exercise: Visualisation of Eurostat data

First part - plot a map

- Download and import the data `unemprate_by_sex.csv` from ILIAS.
- Link the data with map data .
- Visualise the linked data in a map.

If you have that:

- Search for example **here** for datasets containing the country name and visualize the data with `tmap`.

The first law of geography (TFLG)

> "All things are related, but nearby things are more related than distant things" [Tobler, 1970]

A map of Africa

```
library(maptools)
data(wrld_simpl)
Africa <- wrld_simpl[wrld_simpl@data$REGION==2,]
plot(Africa)
```

The center of a polygon

```
library(sp)
Af <- coordinates(Africa)
plot(Africa)
points(x=Af[1,1],y=Af[1,2],col="red",pch=20)
```

Find the nearest neighbours

```
library(spdep)
Af_nb <- tri2nb(Af)
```

Neighbours for the first country:

```
Af_nb[1]
```

```
## [[1]]
## [1] 24 26 27 32 48
```

Find the neighbours

```
plot(Africa)
plot(Africa[1,],col="red",add=T)
plot(Africa[Af_nb[1][[1]],],col="orange",add=T)
```

Find ten next neighbours

```
IDs <- row.names(as(Africa, "data.frame"))
Af10_nb <- knn2nb(knearneigh(Af, k = 10), row.names = IDs)
plot(Africa)
plot(Africa[1,],col="red",add=T)
plot(Africa[Af10_nb[1][[1]],],col="orange",add=T)
```

Compute the distance

```
Af <- coordinates(Africa) # get centroid
library(raster)
pointDistance(Af[1:4,], lonlat=TRUE) # compute distance
```

```
##         [,1]    [,2]    [,3] [,4]
## [1,]       0      NA      NA   NA
## [2,] 4763231       0      NA   NA
## [3,] 2055609 2954497       0   NA
## [4,] 3484053 1295173 1839191    0
```

Calculate/draw a distance matrix

```
Dist_Af <- pointDistance(Af, lonlat=TRUE)
Af_color <- Dist_Af[,1]
Af_color <- Af_color/max(Af_color)
Af_color <- rgb(Af_color,0,0)
plot(Africa,col=Af_color)
```
